Attempt : 2
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Aishu is supervising a construction project that needs to be completed with the help of three workers: A, B, and C.

She knows how many days each of them would take to complete the entire project individually:

A can complete it in x days,B in y days,C in z days.

Initially, all three workers (A, B, and C) work together for d1 days.

After that, C leaves, and only A and B continue for another d2 days.

Then B also leaves, and A works alone to finish the remaining work.

Your tasks is to help aishu to implement this functionality using the class WorkDistribution and Method calculateWork(int x, int y, int z, int d1, int d2)

Calculate the total work completed in the first d1 days by A, B, and C.Calculate the work completed in the next d2 days by A and B.Determine the remaining work after these d1 + d2 days.

Input Format

The first line of input contains five space-separated integers: x y z d1 d2

where:

x represents the Days A takes to complete the work alone

y represents the Days B takes to complete the work alone

z represents the Days C takes to complete the work alone

d1 represents the Days A, B, and C work together

d2 represents the Days A and B work together (after C leaves)

Output Format

The first line of output prints "Work done in first d1 days (A+B+C): " followed by a double value rounded to 2 decimal places.

The second line of output prints "Work done in next d2 days (A+B): " followed by a double value rounded to 2 decimal places.

The third line prints "Remaining work: " followed by a double value rounded to 2 decimal places.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10 20 30 2 2
Output: Work done in first d1 days (A+B+C): 0.37
Work done in next d2 days (A+B): 0.30
Remaining work: 0.33

Answer

```java
import java.util.Scanner;

class WorkDistribution {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        // Input values
        int x = sc.nextInt();  // Time for worker A to complete the work
        int y = sc.nextInt();  // Time for worker B to complete the work
        int z = sc.nextInt();  // Time for worker C to complete the work
        int d1 = sc.nextInt(); // Days in which A, B, and C work
        int d2 = sc.nextInt(); // Days in which A and B work

        // Calculate rates of work per day for each worker
        double rateA = 1.0 / x;
        double rateB = 1.0 / y;
        double rateC = 1.0 / z;

        // Work done in first d1 days by A, B, and C together
        double workD1 = d1 * (rateA + rateB + rateC);

        // Work done in next d2 days by A and B together
        double workD2 = d2 * (rateA + rateB);

        // Total work done and the remaining work
        double totalDone = workD1 + workD2;
        double remaining = 1.0 - totalDone;

        // Output results
        System.out.printf("Work done in first d1 days (A+B+C): %.2f\n", workD1);
        System.out.printf("Work done in next d2 days (A+B): %.2f\n", workD2);
        System.out.printf("Remaining work: %.2f\n", remaining);

        sc.close();
    }
}
```

Status : Correct   *Marks : 10/10*
